

BOSCH

Check your carbon footprint with Worcester today

Worcester is committed to ensuring that everything they do is geared towards energy efficiency in the home. As a result, Worcester has decided to provide a calculator on their website that measures the amount of energy used in your daily life. The idea behind this is to make people more aware of how much they use in their homes and at work therefore it will hopefully encourage people to use more environmentally friendly options.

By answering questions about your home fuel usage and travel, your carbon usage will be displayed and assessed using the scale.

To find out your carbon footprint go to:

<http://www.encraft.co.uk/WorcesterBosch/Calculators/P/CarbonFootprint.php>

Worcester has a huge amount of products that are energy efficient and will reduce the amount of energy wasted therefore saving you money. For instance all of their Greenstar gas boilers are condensing boilers and run at 90% efficiency or over. One of their well-sized solar panel systems could provide up to 60% of your annual hot water requirements and their air source heat pumps convert the free and sustainable latent energy in the air into heat, delivering green, low-cost, energy-saving heating and hot water all year round.

It is interesting to note that 75% of energy used in the home is for heating and hot water. The Government has the following European Union targets to meet by 2020:

- 20% reduction in carbon emissions
- 20% improvement in energy efficiency
- 15% of energy is to come from renewable sources

As an industry leader, Worcester supports and lobbies the Government to help them meet these targets.

So check your carbon footprint out today and see how you could be more 'green' and save money in the home.
